In traditional geometry, affine geometry is considered to be a study between Euclidean geometry and projective geometry. On the one hand, affine geometry is Euclidean geometry with congruence left out; on the other hand, affine geometry may be obtained from projective geometry by the designation of a particular line or plane to represent

Also illuminating is the treatment of affine and Euclidean geometry, which are introduced as specialisations of projective geometry. By singling out a plane at infinity (so you can define parallels) you get affine geometry; then by specifying within this a particular polarity you get a definition of right angles, and from that the Euclidean

Projective Geometry is a term used to describe properties of projections of a given geometric shape. When a shape is projected onto \mathbb{R}^2 (commonly known as the 2D real space), it is called a Planar Projection.
