When the driver has successfully bound itself to that device, then probe() returns zero and the driver model code will finish its part of binding the driver to that device. A driver's probe() may return a negative errno value to indicate that the driver did not bind to this device, in which case it should have released all resources it allocated.

The Linux device model is a complex data structure. For example, consider Chapter 14, which shows (in simplified form) a tiny piece of the device model structure associated with a USB mouse. Down the center of the diagram, we see the part of the core “devices” tree that shows how the mouse is connected to the system.

UIO drivers Linux provides a standard UIO (User I/O) framework for developing user-space-based device drivers. The UIO framework defines a small kernel-space component that performs two key tasks: a. Indicate device memory regions to user space. b. Register for device interrupts and provide interrupt indication to user space.

Hello, I have been struggling to get the internal reference to activate on the AD5629 using the latest AD5064 driver: Omitting the vref-supply parameter resulted in a warning supply vref not found, using dummy regulator, but the internal reference was not activated. I thought I had read that omitting vref-supply from the device definition was the method to activate the internal reference.
