This is an interesting look at multivariable differential calculus, developed for functions on complete normed linear spaces rather than on \mathbb{R}^n . The generality pays off in the last chapter, that develops differential calculus on manifolds. This is intended as an upper-division undergraduate text, and it has lots of examples and challenging ...

In differential calculus basics, you may have learned about differential equations, derivatives, and applications of derivatives. For any given value, the derivative of the function is defined as the rate of change of functions with respect to the given values. Differentiation is a process where we find the derivative of a function.
