Drugs The Brain Drugs 101

Why do people keep taking drugs when they know they're bad for you? Drugs change the brain in ways that make quitting hard, even when you want to. This is because when you take drugs, the neurotransmitter dopamine is released in the basal ganglia in large amounts. Dopamine signals in this brain area "teach" other parts of your brain to keep seeking out the drug so you can take it again and again.

Mind Matters: Drugs and the Brain | NIDA for Teens

All drugs of abuse—nicotine, cocaine, marijuana, and others—affect the brain's "reward" circuit, which is part of the limbic system. Normally, the reward circuit responds to pleasurable experiences by releasing the neurotransmitter dopamine, which creates feelings of pleasure, and tells the brain that this is something important—pay attention and remember it.

The Brain on Drugs | The Center for Life Change

Remember that although it is the drug's effects on the reward pathway that cause the abuser to feel the rush or euphoria, drugs affect many other parts of the brain. For example, when someone smokes marijuana, THC, the main psychoactive chemical in marijuana, localizes to many brain regions.
