The Copper Age, also called the Eneolithic or the Chalcolithic Age, has been traditionally understood as a transitional period between the Neolithic and the Bronze Age, in which a gradual introduction of the metal took place, while stone was still the main resource utilized. Recent archaeology has found that the metal was not introduced so gradually and that this entailed significant social changes, such as developments in the type of habitation, long-distance trade, and copper metallurgy. Rough

Metallurgy during the Copper Age in Europe - Wikipedia

Objects made from smelted copper, from as early as 3800 BC, are known in Iran. Many mineral ores are found on the surface of the earth, in outcrops of rock. Chipping away at them, to pursue the metal-bearing lode down below the surface, leads inevitably to another technological advance - the development of mining. The first miners: from 4000 BC

Arsenic, zinc, antimony, and nickel may well have been known from an early date but only in the alloy state. By 100 bce mercury was known and was produced by heating the sulfide mineral cinnabar and condensing the vapours. Its property of amalgamating (mixing or alloying) with various metals was employed for their recovery and refining.
