Fluxgate Magnetometers For Space Research

Very precise Earth magnetic field measurements in space have been made using fluxgate magnetometers in combination with scalar magnetometers (MAGSAT-Acuna,1979;OERSTED -Primdahl,1999;CHAMP-Lühr,2000) Only a few detailed descriptions about the theory and how to design and calibrate space fluxgate magnetometers and how to get reliable accurate magnetic field component measurements in space have been published.Therefore the worldwide small space fluxgate magnetometer community decided to ...

Fluxgate magnetometers have been part of space missions for decades, from the 1977 launch of the Voyager 1 spacecraft that has traveled farther from Earth than any other human-made object to the new-generation missions using satellites the size of a loaf of bread to study various phenomena of Earth and space. "Fluxgate magnetometers are one of the workhorse instruments in space science missions," Miles says.

Fluxgate sensors are typically ring cores of a highly magnetically permeable alloy around which are wrapped two coil windings: the drive winding and the sense winding (as shown in the figure). Some sensors will also have a third feedback winding, if the sensor is to operate in closed loop.

Each GOES 8-12 satellite was three-axis stabilized and carried two fluxgate magnetometers on a three-meter boom. Only one magnetometer could be operated at a time. The highest resolution magnetic field data was 0.512 s. On the GOES 13, 14 and 15 series, there are two fluxgate magnetometers that can be operated simultaneously on an 8.5 m boom.

More than 250 FGE magnetometers are installed at geomagnetic observatories and variometer stations worldwide. DTU Space itself is operating more than 20 FGE magnetometers , most of them in Greenland. The main idea behind the FGE was to construct a reliable and very stable instrument that is easy to set up and operate.

Many satellites in operation carry vector fluxgate "platform" magnetometers for attitude control, which can offer an alternative to relying on ground observatory measurements during the gap period. However, these instruments need to be carefully calibrated in order to provide meaningful information on Earth's core field.

A magnetometer is a device that measures magnetism—the direction, strength, or relative change of a magnetic field at a particular location. The measurement of the magnetization of a magnetic material (like a ferromagnet) is an example.A compass is one such device, one that measures the direction of an ambient magnetic field, in this case, the Earth's magnetic field.
