[PDF] generalized latent variable modeling eBook

A unifying framework for generalized multilevel structural equation modeling is introduced. The models in the framework, called generalized linear latent and mixed models (GLLAMM), combine features of generalized linear mixed models (GLMM) and structural equation models (SEM) and consist of a response model and a structural model for the latent variables.

Introduction to Generalized Linear Mixed Models

- There is not a “correct” model; – (forget the holy grail)
- A model is a tool for asking a scientific question; – (screw-driver vs. sludge-hammer)
- A useful model combines the data with prior information to address the question of interest.
- Many models are better than one.

Generalized Structural Equation Modeling Using Stata

Show me. Stata's sem command fits linear SEM.. Stata's gsem command fits generalized SEM, by which we mean (1) SEM with generalized linear response variables and (2) SEM with multilevel mixed effects, whether linear or generalized linear.. Generalized linear response variables mean you can fit logistic, probit, Poisson, multinomial logistic, ordered logit, ordered probit, beta, and other models.
