Routine health outcomes measurement is the process of examining whether not interventions are associated with change (for better or worse) in the patient's health status. This change can be directly measured (e.g. by rating scales used by the clinician or patient) or assumed by the use of proxy measurement (e.g. a blood test result).

Outcome measures create cause and effect. At times, outcomes improvement teams can unintentionally impact other metrics, either for better or worse. For example, decreasing the length-of-stay (LOS) following cardiac surgery could result in a higher rate of readmissions.

## **The Who, What, and How of Health Outcome Measures**

An outcome measure is a tool used to assess a patient's current status. Outcome measures may provide a score, an interpretation of results and at times a risk categorization of the patient. Prior to providing any intervention, an outcome measure provides baseline data. The initial results may help determine the course of treatment intervention.
