Now, let's start talking about acid-base disturbances, which are divided into four types: metabolic acidosis, respiratory acidosis, metabolic alkalosis and respiratory alkalosis. In order to determine which is which, the 4 high yield parameters are: pH, pCO<sub>2</sub>, bicarbonate levels and compensatory response.

5.0 out of 5 stars High-Yield Acid-Base (High-Yield Series) Reviewed in the United States on April 7, 2009. I've read the previous version, so I'm hoping that this edition will only be an improvement. This is a great review that takes complex acid base disorders and distills them down to an easy day read.

You might have an acid-base disorder

question. I had a very easy one that I

don't remember. Don't go too crazy

remembering how the Henderson-

Hasselbach equation is derived. It's

irrelevant for this type of exam. DO

know the reference ranges for the blood

gases, as well as pH. It might be on your

exam!

(high values of  $K_a$  and  $K_b$ ), they will both fully dissociate, which means all the molecules of acid or base will completely separate into ions. At the equivalence point, equal amounts of  $H^+$  and  $OH^-$  ions will combine to form  $H_2O$ , resulting in a pH of 7.0 (neutral).

## **Now, That's What I Call High-Yield: Acid-Base Physiology**

The Arrhenius theory, which is the simplest and least general description of acids and bases, includes acids such as  $\text{HClO}_4$  and  $\text{HBr}$  and bases such as  $\text{NaOH}$  or  $\text{Mg}(\text{OH})_2$ . For example the complete dissociation of  $\text{HBr}$  gas into water results generates free  $\text{H}_3\text{O}^+$  ions.

## **Overview of Acids and Bases - Chemistry LibreTexts**

The first curve shows a strong acid being titrated by a strong base. There is the initial slow rise in pH until the reaction nears the point where just enough base is added to neutralize all the initial acid. This point is called the equivalence point. For a strong acid/base reaction, this occurs at  $\text{pH} = 7$ .
