Physico-chemical Water Treatment Processes Wastewater contains particles of different sizes which can be classified as dissolved (< 0.08 µm), colloidal (0.08 - 1 µm), supracolloidal (> 100 - 100 mm) and settleable (> 100 µm). The type of treatment selected depends on the size of particles present in the wastewater.

Physicochemical parameters such as turbidity, pH, temperature, nitrate and others with respect to water quality are widely accepted as other critical water quality parameters describing the quality of drinking water. In Ethiopia, access to improved water supply and sanitation is very low and it is estimated to be 38%

· There is no organoleptic, chemical or physical change to the water quality. · Overexposure does not have any ill effects. The main disadvantages are: · Electricity supply should be reliable. · Turbidity reduces efficiency. · Water may require prior treatment like filtration. · The unit requires regular inspection and maintenance.

Chapter 2 - WATER QUALITY MONITORING, STANDARDS AND TREATMENT
Pollution of the river first affects its chemical quality and systematically destroys the community disrupting the delicate food web. Water quality parameters which affect the survival, reproduction, growth and production of aquatic species are called water quality variables (Chhatawa,1998).

Assessment of Water Quality with Physico-Chemical Parameters
Physicochemical wastewater treatment techniques are applied for the removal of heavy metals, oils and greases, suspended matter and emulgating organic substances, organic and inorganic components, difficult to decompose non polar organic substances, toxic pollutants or high salt concentrations, phosphorus,...

Water treatment plants have physical quality criteria including screening and controlling colour, odour and temperature. Also, they have a series of chemical quality criteria including chemical quality refinement, hardness removal, desalination, fluorine injection and alkalinity which some of them are investigated in this study (Spellman 2013; Ang et al. 2015; Hua et al. 2015).

Second, we will explore the basic chemical concepts needed to understand how pollutants may change their forms and influence water quality. Finally, we will learn different physicochemical processes used at drinking water treatment processes and how they will remove water pollutants and improve the water quality.
