In terms of power management, the worst-case condition for such telecom supplies is the worst-case maximum load current (I nom plus 40%), which occurs when the output voltage is still regulated. Delivered power is 40% above nominal and can persist indefinitely. The entire power supply must be capable of withstanding this level of output power.

Modern telecommunications systems tend to use local dc/dc converters providing fixed-output voltages independent of the power system bus voltage. This constant-power demand results in an increasing input current as the bus voltage falls. A constant-power load that consumes 1 A at 55 V consumes 1.3 A at 40 V.
