of water quality by any process that changes ambient water temperature. A common cause of thermal pollution is the use of water as a coolant by power plants and industrial manufacturers. When water used as a coolant is returned to the natural environment at a higher temperature, the sudden change in temperature decreases oxygen supply and affects ecosystem composition. Fish and other organisms adapted to particular temp

Some plants use cooling ponds. They are man-made and used resources are cooled using evaporation, radiation, or convection. Other methods include cooling towers, which transfer the heat to the atmosphere instead of into the ocean, and cogeneration that recycles the excess heat. Power plants can cool water.
